## **Automated blood cell count**

**Disclaimer:** As automated blood cell counts are nowaydays exclusively performed on commercial platforms, multiple images used in this presentation are from commercial origin. These do not reflect any preference or quality judgement and are mainly intended to illustrate general principles.

## Introduction

## What are we talking about?

"CBC"

Reimbursed parameters

- Hemoglobin
- Thrombocytes
- Hct/RBC
- ▶ WBC
- Differentiation
- Reticulocytes

'Associated' parameters

- MCV, MCH, MCHC
- MPV
- Immature reticulocyte fraction
- Immature platelet fraction
- ...

Calculated parameters

Immature platelet fraction: A useful marker for identifying the cause of thrombocytopenia and predicting platelet recovery

## Advantages of automation and technical evolutions

- Major reduction in TAT
- Major decrease in CV% => enhanced reliability of results
- Sample throughput
- Smaller blood volumes
- Additional information ('associated' parameters)
- Pre-analytical control

# Part 1: Technical details and principles of automated hematology Analyzers

## **General principles**

Each analyzer uses a combination of detection principles to separate and count the individual cells in blood, based on the unique properties of these cells (size, granularity, RNAcontent,...)

These detection principles are chosen to be cheap, quick, reproducible, robust and automatable

- Most of these properties are not absolute specific for a cell-type (eg CD41 based measurement of PLT vs size-based measurement)
- If cells shows 'abnormal' properties (eg, giant thromobcytes, cells with increased metabolic activity,...), these may (or may not) behave differently in a specific measurement technique and lead to spurious counts.
- Designed to count 'normal' cells and detect presence of abnormal cells (morphology/FCM: identify and type abnormal cells)

## Hemoglobin

• Colorimetry

## Colorimetry

Reference-method: cyaanmethemoglobine method

- Stable cyano-Hb complex after RBC-lysis, measurement of absorption at specific wavelength
- Difficult to automate (=slow reaction)
- Need for toxic CN-chemicals

Blood cells, Bain

In routine practice: CN-free methods and reagents

- » Step 1: The cell membranes of RBC are lysed. That releases haemoglobin from the red blood cells.
- » Step 2: The free haemoglobin undergoes a change in its 3D-structure due the bond between the hydrophobic group of SLS and globin.
- » Step 3: The divalent haeme iron (Fe<sup>2+</sup>) is changed to trivalent iron (Fe<sup>3+</sup>) by the oxygen bound to the haeme iron.

Bron: Sysmex

## Haemoglobin Measurement

 The haemoglobin concentration is determined from the absorbance measured by a photometric method at 555 nm.

### Interferentie by turbidity, eg lipemia

SYSMEX Ughting the way with diagnostics

Bron: Sysmex

## **RBC-PLT**

- ImpedanceLight ScatterFluorescence

# Impedance (RBC-PLT) (Sysmex, Abbott, Beckman)

# Impedance (RBC-PLT) (Sysmex, Abbott, Beckman)

- » Volumetric measurement of RBC and platelets using absolute counting by DC detection method with hydrodynamic focusing (HDF).
- » A diluted sample is ejected from the nozzle tip and the blood cells enclosed in sheath fluid pass through a defined path at the centre of the aperture as depicted in the image below.

Bron: Sysmex

- » As each blood cell passes through the centre of the aperture, an electric resistance that is proportional to the volume of that blood cell is created.
- » This information is plotted as a histogram and deviations from the expected results trigger IP message(s).

## **RBC** Histogram

## Impedance = 'particle' counter

### **Prone to interferences**

- o Fragmentocytes
- Microcytes
- Giant trombocytes
- PLT aggregates......

## Light scatter (RBC-PLT) (Siemens, Abbott)

IAS1 predominantly measures intracellular HGB and IAS2 mainly RBC volume

### Abbott: impedance and light scattering

PLT method: multidimensional light scatter

- RBC, MCV, Hgb (and MCHC) measured
- Hct, MCHC (calculated), MCH are calculated
- Availability of measured and calculated MCHC allows for internal quality control

Light scattering allows for better discrimination between PLT and RBC (fragments)

- When platelets and RBCs are similar in size (microcytic RBC, RBC fragments, large or giant platelets) electrical impedance or dual angle light scatter may demonstrate signal overlap
- With the implementation of multi-dimensional analysis, platelets and RBCs of similar size demonstrate unique signal signatures with the array of different angles of light scatter

## Fluorescence (PLT) (Sysmex)

- » Fluorocell PLT-F stains RNA in PLT by reagent component Oxazine
- Differentiation of populations by fluorescence intensity and size
- » Reticulocytes and RBC are not stained

specific platelet staining

FSC: Forward Scattered Light SFL: Side Fluorescence

## Scattering, Impedance, Fluorescence: does it matter?

Compare the accuracy and precision of Coulter LH780, Mindray BC-6000 Plus, and Sysmex XN-9000 with the international reference flow cytometric method in platelet counting

# Fluorescence – Light Scattering (WBC) (Abbott)

M.A.P.S.S. TECHNOLOGY Multi Angle Polarized Scatter Separation

Counting and differentiating of blood cells in a near native state by use of their light scattering characteristics

- The WBC reagent contains lytic agents and a proprietary membrane-permeable, fluorescent nuclear dye
- The fluorescent dye stains all nucleated cells (nucleic acid in WBC and NRBC) and does not stain RBC

Monocytes Eosinophilic granulocytes Basophilic granulocytes Lymphocytes Nucleated Red Cells

Combination of multiple plots and cluster analysis are used for **quantification** and **flagging** performance.

# Impedance – Light Scattering (WBC) (Beckman)

#### VOLUME:

As opposed to using 0ø light loss to estimate cell size, VCS utilizes the Coulter Principle of (DC) Impedance to physically measure the volume that the entire cell displaces in an isotonic diluent. This method accurately sizes all cell types regardless of their orientation in the light path.

#### CONDUCTIVITY:

Alternating current in the radio frequency (RF) range short circuits the bipolar lipid layer of a cell's membrane, allowing the energy to penetrate the cell. This powerful probe is used to collect information about the internal structure of the cell, including chemical composition and nuclear volume.

#### SCATTER:

When a cell is struck by the coherent light of a LASER beam, the scattered light spreads out in all directions. Using a proprietary new detector, median angle light scatter signals are collected to obtain information about cellular granularity, nuclear lobularity and cell surface structure.

Fig. 2.9 Printouts from Beckman-Coditer DxB 800. Mathias Bruegel\*, Dorothea Nagel, Manuela Funk, Petra Fuhrmann, Johannes Zander and Daniel Teupser

Comparison of five automated hematology analyzers in a university hospital setting: Abbott Cell-Dyn Sapphire, Beckman Coulter DxH 800, Siemens Advia 2120i, Sysmex XE-5000, and Sysmex XN-2000

## Example to illustrate the 'power' of current techniques

Male, 43yrs, referred from GP due to pancytopenia, Recent travel: infectious? Acute leukemia? MDS?

## Conclusions

- Multiple techniques, each with their own strengths and weakness
- Calculated vs measured parameters may be analyzer specific
- Quantification, differentation and flagging performance is based on "behaviour" of a cell population in a specific measuring method
- Scattergram/plots from an automated analyzer are an important source of information and may be an aid in interpretation for difficult cases.

# Part 2: Hemato-analyzer vs microscopic differentiation

## **Microscopy – golden standard?**

MONO# (DIFF)

EO# (Diff)

BASO# (Diff)

VAR.LYMPH#

## **Microscopy vs Analyzer diff**

### Counting = Analyzer

except: -quantification of sub-populations that cannot be quantified by the analyzer (blasts, meta/myelo/promyelo,...)

-populations cannot be clustered by the analyser

- Screening for and detection/confirmation of morphologic abnormalities = microscopy
- Even in the presence of abnormal cells, it may be better to describe the morphology and to report the analyzer diff (prototype example, CLL)

## **Part 3: Workflow-organisation**

## Major "threat" in highly automated setting

- One tends to loose control on individual samples -> results are reported (and acted on) before results can be reviewed by the supervisor
- Key to know and understand technical details, strengths and weaknesses, patient population, risk factors for spurious counts, ... to implement an optimal workflow with minimal risk on clinically relevant errors.
- > Process of continuous review, improvement and communication

## Which samples need "review"?

▶ Review: microscopy, scattergram review by technician/biologist, alternative methods,...

Indications: -Screening for abnormal cells

 -WBC differentiation if analyzer fails to cluster
 -explain observed flags and estimate impact
 -exclude interferences

### Design of a rule set

- Technical rules (ie reported results may not be reliable)
- "morphological" rules (ie presence of abnormal WBC populations)
- "biological" rules (ie unexpected or abnormal results-> close the gap in technical and morphological rules)

## Technical rules (analyzer specific)

### PLT Abnormal distribution

Reflex with another method/review of plausibility necessary

## Technical rules (fabrikant-specifiek)

### Increased MCHC (1) (or discrepancy measured MCHC vs calculated MCHC)

Test	Run 1 - XN-1	
SMEAR	16/12/2020 12:21	
Smear		
SMEAR	DIFF	
CBC Pro		
WBC	10.24	
RBC	0.54	
HGB	9.6	
НСТ	6.5 (Bellen)	
MCV	120.4	
МСН	177.8	
MCHC	147.7	
PLT	194	

### After incuation at 37°C

### Hb reliable, RBC not

## Technical rules (fabrikant-specifiek)

### Increased MCHC (1) (or discrepancy measured MCHC vs calculated MCHC)

## "Morphological" rules

WBC subpopulation behave differently compared to normale samples (higher RNA content, more/less granularity, larger cells,...) => Requires microscopy review

Population specific exceptions are possible:

- No differentiation of Immature Granulocytes
- Patient known with normoblasts -> no confirmation/screening
- Known CLL-patients -> report analyzer diff/confirm morphology

• ...

### ABOUT THE ISLH

### **Consensus Guidelines: Preface**

The International Consensus Group for Hematology Review is pleased to publish the attached guideline:

Suggested Criteria for Action Following Automated CBC and WBC Differential Analysis

# **Biological rules**

### Based on patient characteristics

3.1.1. Is it necessary to do a smear systematically depending on the age of the patient?

> A patient's age is not a criterion for adults. With neonates, during the first week of life, smear revision is recommended at least at the time the first CBC is performed, due to the frequent erythroblastaemia (see also the section 'Indications regarding the WBC diff'). In children younger

#### 3.1.2. Prescribing physician or hospitalisation service

A systematic smear review is needed for patients from the paediatric haematology-oncology unit that are unknown or without recent morphological information. This is due mainly to the fact that analysers usually have problems detecting lymphoblast cells when they are present in low numbers (18). Apart from this particular situation, a physician's opinion is not considered a criterion that must lead to a smear review. The biologist in the lab can trust

#### 3.1.3. Permanent reference regarding information of the patient

If an abnormality was identified for the first time in a patient, registering a permanent comment associated with that patient's information can be useful for validating subsequent CBCs faster and more securely. An example would be the presence of cryoglobulins or WBC agglutinations, which are important in terms of the cell count. A permanent message associated with the patient that points out this situation can be used as a criterion for performing the analysis at 37°C or a smear review next time.

#### 3.1.4. Specific prescription of the morphological analysis

This type of prescription necessarily involves smear review and an explicit comment to the prescribing physician in return. In the absence of abnormal cells, the analyser cell count, which is more precise, is preferred to the manual count. If the prescription asks for schizocytes, the search for them can be performed differently. The responsible biologist can decide whether or not there is a need to perform a blood smear. This will depend on the laboratory and whether its analyser is capable of quantifying RBC fragments (19). If a schizocytes count is required in the end, this will be done in line with the recommendations published recently (20).

# **Biological rules**

• Based on quantitative abormalities

Former result	Adults/children	Presence of malignant cells, as observed with the former result Presence of NRBC, as observed with the former result (if they are not counted automatically by an analyser)
NRBC	Adults/children	NRBC have been detected by the analyser, in an initial situation or every time if they are not counted automatically by the analyser
Neutrophils	Adults/children	< 1.5 x 10 <sup>9</sup> cells/L, in an initial situation
Eosinophils	Adults/children	$> 1.5 \text{ x } 10^9 \text{ cells/L}$ , in an initial situation
Basophils	Adults/children	$> 0.3 \text{ x } 10^9 \text{ cells/L and/or} > 3\%$ , in an initial situation
	Adults	$> 5 \ge 10^9$ cells/L, in an initial situation
Lymphocytes	Children	$>9 \ x \ 10^{9} \ cells/L$ (two to six years), $>6 \ x \ 10^{9} \ cells/L$ (six to 12 years), $>4 \ x \ 10^{9} \ cells/L$ (>12 years), in an initial situation
Monocytes	Adults/children	$> 1.5 \ x \ 10^9 \ cells/L$ , in an initial situation $> 1.5 \ x \ 10^9 \ cells/L$ , if persistent for more than 30 days > a threshold, which is to be defined for each laboratory when monocytosis occurs during hospitalisation

### Diagnostic PB-sample of AML-M3 (hypoleukocytair)

#### Rules

- 57. Multiple runs!
- WBC morph positive -> Smear!
- 71. Leukocytopenia in "Initial situation" -> Smear-
- 50. HgB < 7 -> INFORM DOCTOR
- 76. WBC < 2.5 -> INFORM DOCTOR
- 110. PLT low in "initial situation" -> CHECK FOR CLOT and check smear
- 114. Neutropenia in "Initial situation" -> Smear
