

# POST- ASH MEETING

Dr. Anna Vantilborgh  
Hematologie - UZ Gent

6 januari 2012

# PLATELETS AND COAGULATION

## ➔ I. Thrombosis

- ➔ IA. New anti-aggregant drugs
- ➔ IB. New anticoagulant drugs

## ➔ II. Hemostasis

- ➔ Gene therapy : viral vector → production of clotting factor
- ➔ Identification of agents that increase expression or stimulate release of coagulation proteins
- ➔ Emerging non peptide molecules that affect hemostasis
- ➔ Bio-engineering strategies to modify hemostatic proteins

## IA. New anti-aggregant drugs

- ➔ **elinogrel**
- ➔ **vorapaxar**
- ➔ **atopaxar**
- ➔ **rutin**

# elinogrel

- ➔ **Mechanism of action**
  - ➔ reversible inhibition of P2Y<sub>12</sub> receptor
- ➔ **Structure**
  - ➔ quinazoline-2,4-dione
- ➔ **Route of administration**
  - ➔ oral and intravenous
- ➔ **Stage of development**
  - ➔ fase II trial = INNOVATE-PCI → fase III trial starting

## PAR (protease activated receptor) antagonist

- ➔ **Thrombin is a potent activator of human platelets via action on two platelet surface G-protein coupled receptors PAR 1 and PAR 4**
- ➔ **PAR 1- and PAR 4-antagonists are therefore inhibitors of thrombin-induced platelet activation; but they do not affect thrombin-induced cleavage of fibrinogen**

## SCH 530348 = vorapaxar

### ➔ Mechanism of action

- ➔ reversible PAR1 inhibition

### ➔ Structure

- ➔ tricyclic 3-phenylpyridine analog of himbacine

### ➔ Route of administration

- ➔ per os

### ➔ Stage of development

- ➔ fase III trial (TRA-CER, TRA 2P-TIMI 50 : stop 1 of 3 arms due to excessive intracranial hemorrhage in patients with history of ischemic stroke) // Ticocci et al, NEJM 23 nov 2011

## E5555 = atopaxar

- ➔ **Mechanism of action**
  - ➔ reversible PAR1 inhibition
- ➔ **Structure**
  - ➔ 2-iminopyrrolidine antagonist
- ➔ **Route of administration**
  - ➔ per os
- ➔ **Stage of development**
  - ➔ fase II trial

# rutin

- ➔ **Mechanism of action**
  - ➔ reversible PAR4 inhibition
- ➔ **Structure**
  - ➔ quercetin rutinoside (flavonoid family)
- ➔ **Route of administration**
  - ➔ po and IV
- ➔ **Stage of development**
  - ➔ preclinical

## IB. New anticoagulant drugs

- ➔ **semuloparine**
- ➔ **edoxaban**
- ➔ **ISIS-FXI**

## semuloparine

- ➔ **ULMWH = ultra low molecular weight heparin**
- ➔ **Anti-Xa activity >> anti-IIa activity**
- ➔ **Renal excretion**
- ➔ **Subcutaneous administration**
- ➔ **Advantages**
  - ➔ Half-life = 17 hours (once daily dosing)
  - ➔ Rapid onset of action : Cmax reached after 3 hours
- ➔ **SAVE-ONCO trial : 1,2% VTE vs. control 3,4 %; but no difference in mortality due to VTE**

## edoxaban

- ➔ **Anti-Xa activity**
- ➔ **Oral administration**
- ➔ **62% bio-availability**
- ➔ **Rapid onset of action**
- ➔ **Half-life = 8 to 10 hours**
- ➔ **STARS E-III + STARS J-V trial (dubbelblind dubbel-dummy edoxaban 30 mg po versus enoxaparin 2 \* 20 mg/d SC) : less VTE, no excess bleeding**

## ISIS-FXI RX

- ➔ **Antisense inhibitor of F XI**
- ➔ **Target = mRNA (intranuclear)**
- ➔ **20 base single strand inhibits transcription and blocks protein production**
- ➔ **Slow onset of action = 14 days**
- ➔ **Half-life = 20 days (dosing every other week)**
- ➔ **No limitation in renal or hepatic failure**
- ➔ **No drug-drug interaction**
- ➔ **Fase II trial**

## II. Hemostatic drugs

- ➔ 1. Gene therapy : viral vector → production of clotting factor
- ➔ 2. Identification of agents that increase expression or stimulate release of coagulation proteins
- ➔ 3. Emerging non peptide molecules that affect hemostasis
- ➔ 4. Bio-engineering strategies to modify hemostatic proteins

# 1. Gene therapy

- ➔ **viral vector = serotype-8-pseudotyped self-complementary adenovirus-associated virus (AAV)**
- ➔ **production of codon-optimized factor IX**
- ➔ **FU : 6 - 16 months**
- ➔ **6 patients with severe hemophilia B**
- ➔ **3 cohorts = high, intermediate or low dose viral vector (all without immunosuppressive therapy)**
- ➔ **level of factor IX activity 2 to 11%**
- ➔ **4 could stop prophylaxis and 2 were able to increase interval between injections (still need for clotting factor in case of bleeding and/or surgery)**

Amit C. Nathwani, Edward GD Tuddenham, et al.  
NEJM. Dec 2011;365:2357-2365

## 2. Identification of agents that increase expression or stimulate release of coagulation proteins

### ➔ Interleukin-11

- ➔ Increases plasma levels of VWF and FVIII
- ➔ Gradual and sustained elevation (opposite to DDAVP)
- ➔ DDAVP releasable pool unaffected
- ➔ Fase II trial using rhIL-11 = Neumega

### 3. Emerging non peptide molecules that affect hemostasis

- ➔ **3.1 Fucoidans (NASP)**
- ➔ **3.2 Small molecule-induced read-through of nonsense mutations**

## 3.1 Fucoidans = NASP (non-anticoagulant-sulfated polysaccharides)

### ➔ Structure

- ➔ Heterogeneously sized, strongly anionic compounds with a fucose backbone derived from brown seaweed (e.g. AV513)

### ➔ Mechanism of action

- ➔ Anti TFPI activity

### ➔ Potential strengths

- ➔ Oral or subcutaneous administration
- ➔ Reduce dependence on clotting factor concentrate

### ➔ Potential limitations

- ➔ May exert paradoxal anticoagulant effect at higher doses

### ➔ Stage of development

- ➔ Preclinical (mice and dogs)

## 3.2 Small molecule-induced read-through of nonsense mutations

### ➔ Mechanisme of action

- ➔ Dose dependent read-through of UGA / UAA / UGA nonsense mutation

### ➔ Structure

- ➔ PTC124 = oxidiazole linked to flurobenzene and benzoic acid ring

### ➔ Potential strenghts

- ➔ Oral or subcutaneous administration
- ➔ Reduce functional severity of hemophilic phenotype A or B

### ➔ Potential limitations

- ➔ Only for patients with nonsense mutations (also CF, Duchenne, ...)

### ➔ Stage of development

- ➔ Fase II trial

## 4. Bio-engineering strategies to modify hemostatic proteins

### ➔ 4.1 Wish list for characteristics of hemophilic treatment

- ➔ Least invasive method of administration (TD, po, SC, nasal)
- ➔ Least requirement for dose manipulation due to interindividual differences in recovery / clearance
- ➔ Maximal (supraphysiologic) half-life
- ➔ Lowest or (even better) no immunogenicity
- ➔ Highest tolerability
- ➔ Lowest thrombogenic risk
- ➔ Lowest cost

## ➔ 4.2 Mechanisms

- ➔ Chemical modification
  - ➔ PEGylation, glycoPEGylation, polysialylation
- ➔ Fusion to protein conjugates
  - ➔ Fc-IgG fusion, fusion to albumin, fusion to transmucosal carrier protein
- ➔ Site-directed mutagenesis : rhFVIIa (NN1731 / BAY86-6150)

<p><b>PEGylation</b></p>	<ul style="list-style-type: none"> <li>-Prolongs half-life</li> <li>-Reduces immunogenicity by shielding epitopes</li> <li>-Widely used</li> </ul>	<ul style="list-style-type: none"> <li>-Formation of PEG Ab</li> <li>-Accumulation of PEG</li> <li>-Non targeted conjugation may mask essential functional residues</li> </ul>	<ul style="list-style-type: none"> <li>-Fase I : PEG-BDD-rFVIII, glyco-PEG-rFIX</li> <li>-Fase II/III : glyco-PEG-rFVIIa</li> </ul>
<p><b>Polysialylation</b></p>	<ul style="list-style-type: none"> <li>-Length of PAS determines half-life</li> <li>-Naturally occurring</li> <li>-Non immunogenic</li> </ul>	<ul style="list-style-type: none"> <li>- PSA polymers may interfere with enzymatic activity of therapeutic proteins</li> </ul>	<p>Only animal models : PSA-rFVIII (murine)</p>

<p><b>Fc fusion</b></p>	<p>-Binding of IgG-Fc fused to therapeutic protein to FcRn in endothelial cells</p> <p>-Low immunogenicity of Fc</p>	<p>-No shielding of therapeutic protein from neutralizing circulating Ab</p>	<p>-Fase II/III : rFVIII-Fc and rFIX-Fc</p>
<p><b>Albumin fusion</b></p>	<p>-Prolongs t <math>\frac{1}{2}</math></p>	<p>-No shielding from immune effector cells</p>	<p>-Preclinical : rFVIIa</p> <p>-Fase I/II : rFIX</p>

<p><b>Fusion to transmucosal carrier protein</b></p>	<p>-May reduce inhibitor formation and anafylaxis -Bio-encapsulation allows oral formula</p>	<p>-Hemostatic activity of fused factor protein likely negligible</p>	<p>- Animal model only : rFIX</p>
<p><b>Site-directed mutagenesis</b></p>	<p>-Increased hemostatic activity -Decreased proteolytic inactivation</p>	<p>-Increased thrombogenic risk -No shielding from immune cells or Ab</p>	<p>-In vitro and animal model : rFIX-FX hybrid -Fase I : rFVIIa (BAY 86-6150) -Fase II : rFVIIa (NN1371)</p>
